

Introducing our new *Riley* Windows Home Server and Storage Server range ...

..be seen, not heard..

Riley Servers, designed and made in UK

All Riley Servers and Storage units have been designed with one thing in mind –absolute customer satisfaction. Not only are the appliances beautifully designed and would find themselves at home in any environment, they also are designed to provide maximum reliability and protection of your valuable data, via multiple disks and backups systems. Everything about the Riley series screams ‘quality’ - although you won’t hear any sound.

How it’s made

The Riley range of servers and storage solutions is the first suite of Server appliances produced using our new ‘in-house’ machining capabilities. Tranquil PC Ltd recently invested in high precision, high speed CNC milling facilities providing us with the technology to have more control over our designs and enabling us to deliver servers and PC’s to a quality never seen before. Each server and storage solution is milled out of a solid block of aluminium and then anodised to the highest MIL standards. This process when teamed with our ‘in-house’ design facility means prompt delivery of attractive, silent and reliable devices. Each component that generates heat (ie CPU) is cooled through the heat sink chassis,

Under the bonnet

The Riley range is built around the same successful building blocks as the SQA-5H/Leo-HS4 offering the option of either Intel Atom Dual Core CPUs (model *CM10*) or the very popular Intel 2nd Generation Core Processors (models *CM30* and *CM50*).

The concept of the Riley range is to have a processor unit which houses the heart of the server fitted with the mainboard and two small hard disks; one running the OS and the other acting as a back-up for this. The storage unit is a device matching the processor unit’s footprint but houses up to four 3.5” hard disks in numerous RAID formats (12TB max, 9TB in RAID5) again completely fan-less and sealed - connected via a single eSATA cable. The Intel 2nd Generation Core processor unit supports up to three of these storage devices.

Operating Systems

You can choose your own Operating System—either **Windows Home Server** for up to 10 users (Riley *CM10*, *CM30* or *CM50*), or **Windows Storage Server 2008 R2 Essentials** for up to 25 users (Riley *SS10*, *SS30* or *SS50*).
